

Satellite Harvest

Generating ground truth data for agricultural remote sensing by coupling satellite and Google Street View imagery

PI10 : PROJECT REVIEW 4

Client : Dr Inbal Becker-Reshef

Supervisor : Mr Josef Wagner
Mr Shabarinath Nair

Mentor : Benoît Lebrun

Project manager : Mathys Fillinger

Project members : Boutayna Lakhmi
Martin Fiack
Quentin Duvernay

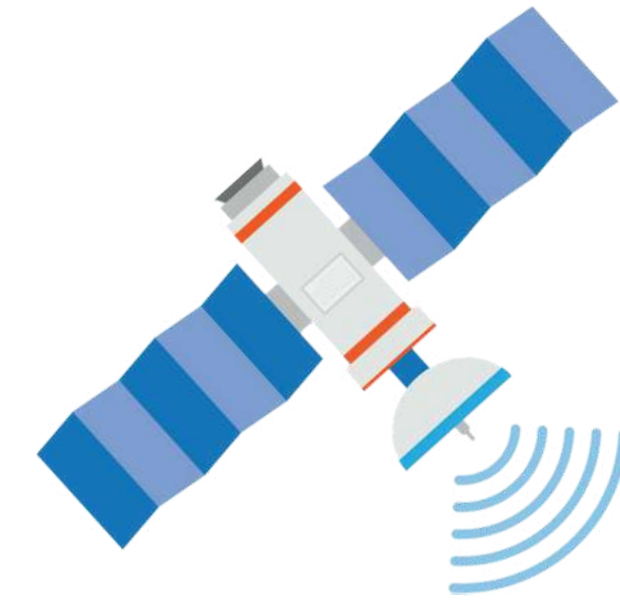

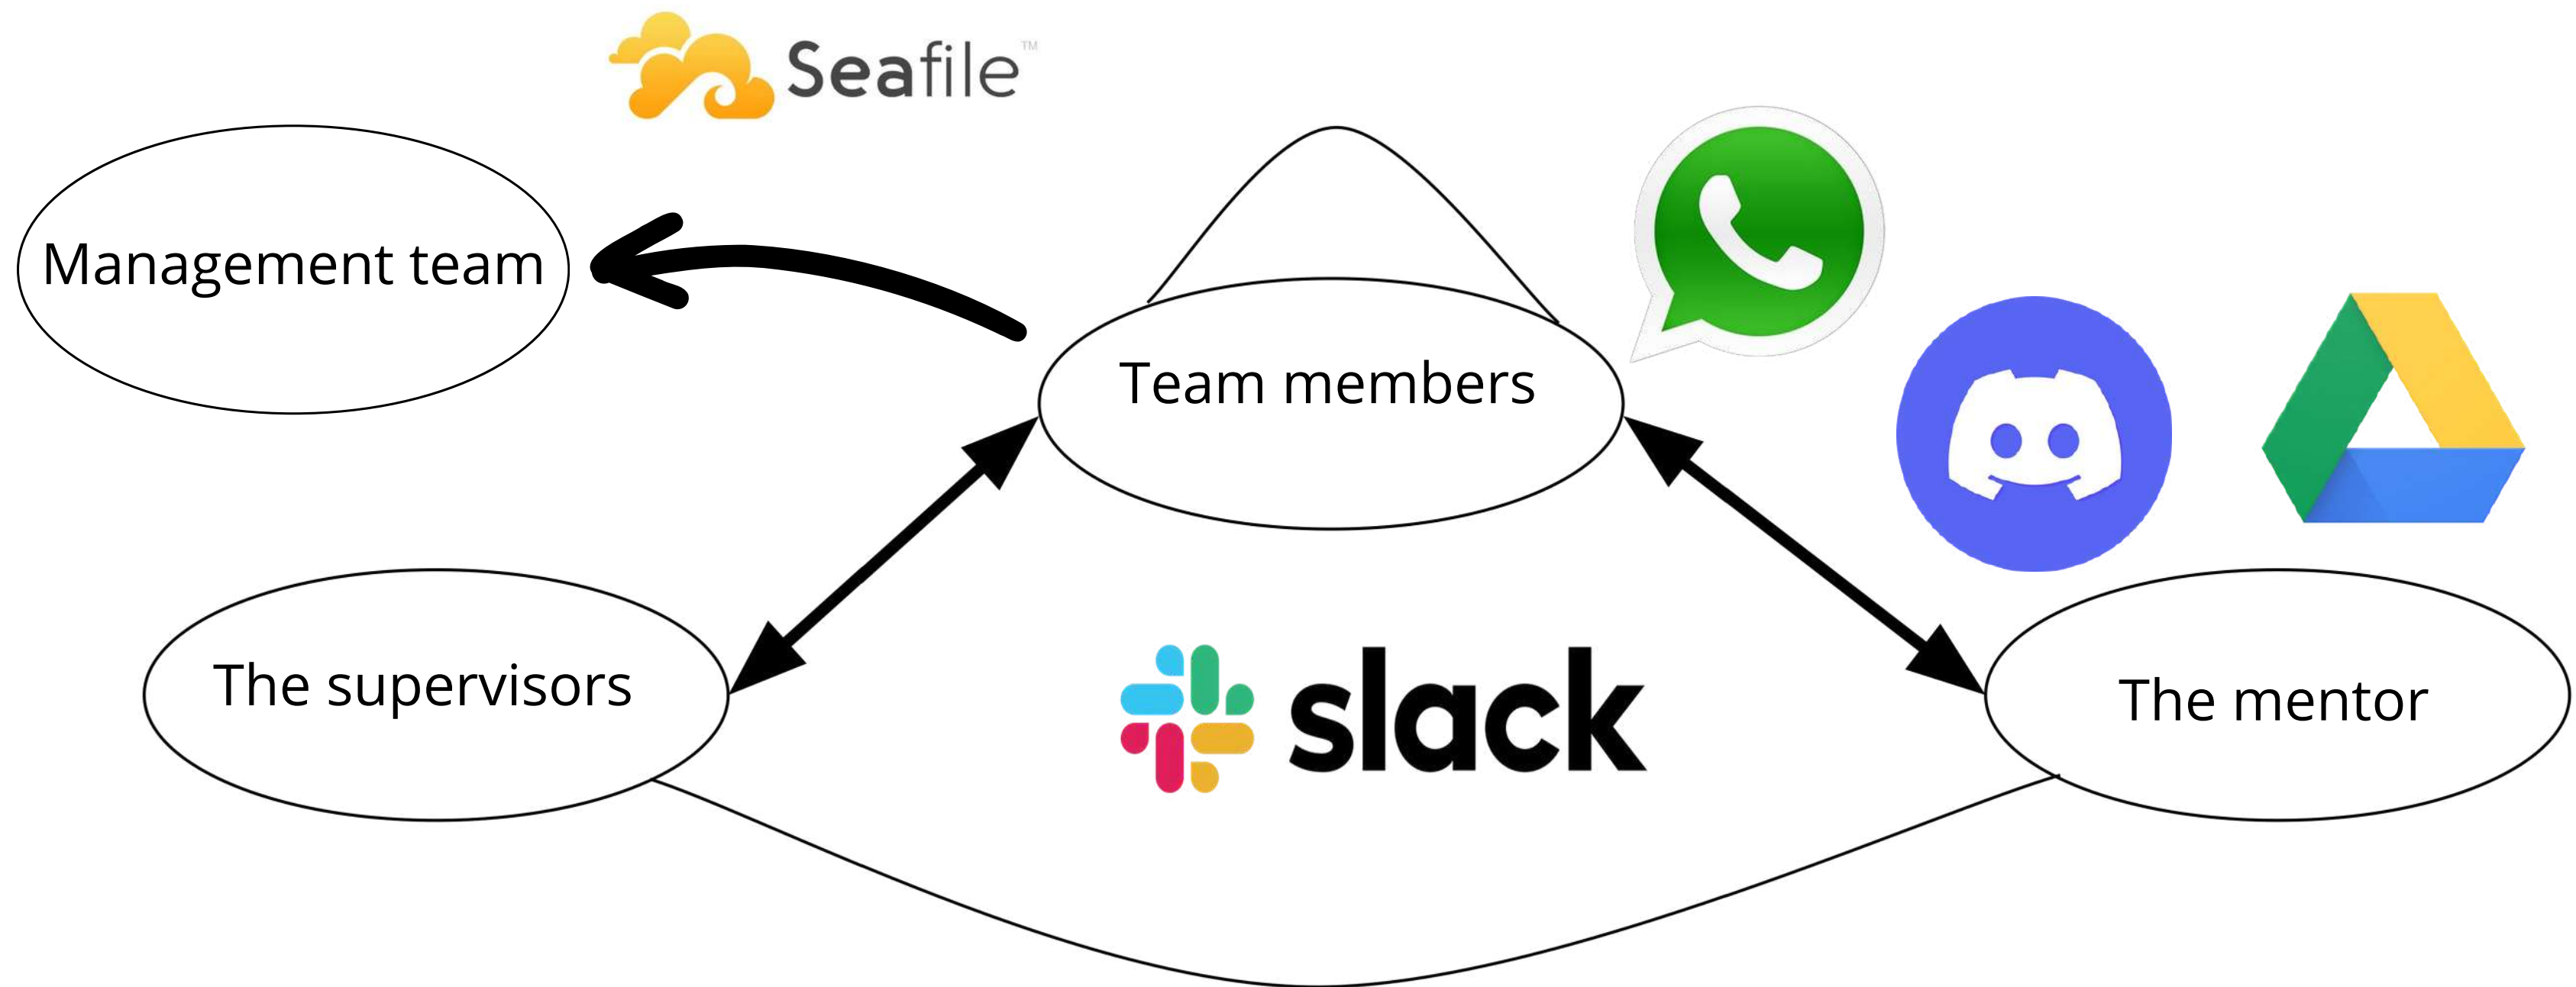

Table of contents

Presentation Communication

Objectives of the project

A need for ground truth data

Food security by monitoring crop productivity across the globe

Address the lack of agricultural data in some countries (Kenya)

**Tremendous amount of data from satellite :
WorldView-3 revisit time < 1 day**

Deliverables

Type of deliverable	Description
Digital version	<p>A Github repository including :</p> <ul style="list-style-type: none"> - Commented python codes in English - Trained models with calculated evaluation metrics - Labeled datasets used to train the model - Implementation of the model in France and in Kenya
Documentation	A written report in english
Presentation	<p>A poster</p> <p>A demonstration video</p>

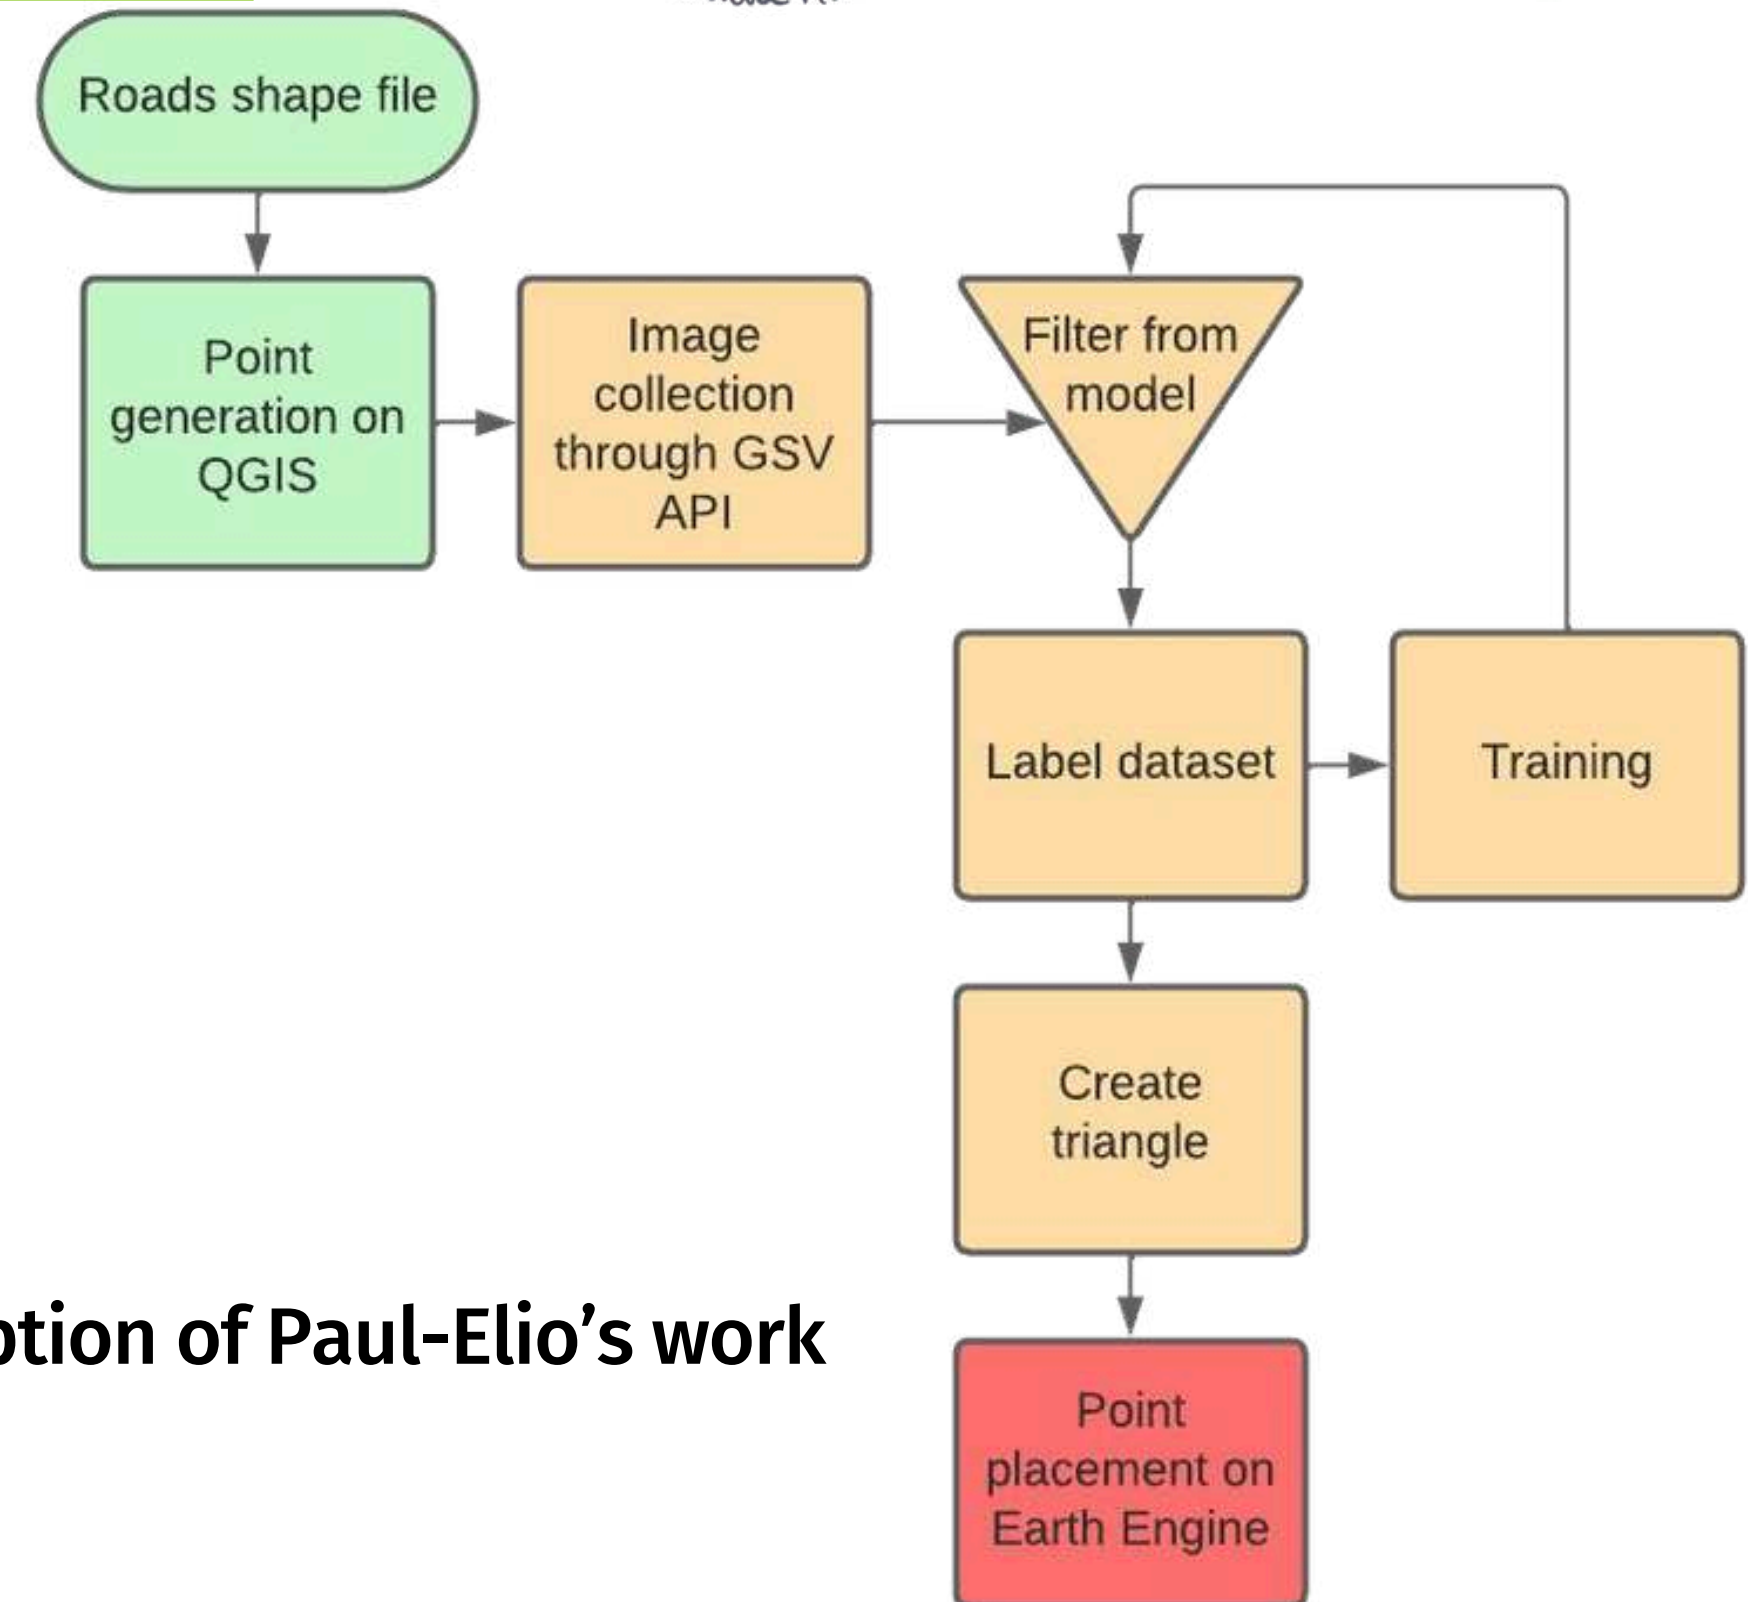

Deliverables table

Initial project status

- Paul-Elio Fresneau's final year internship at Télécom Physique Strasbourg
- Binary model : Crop/non-crop
- Pipeline of his model

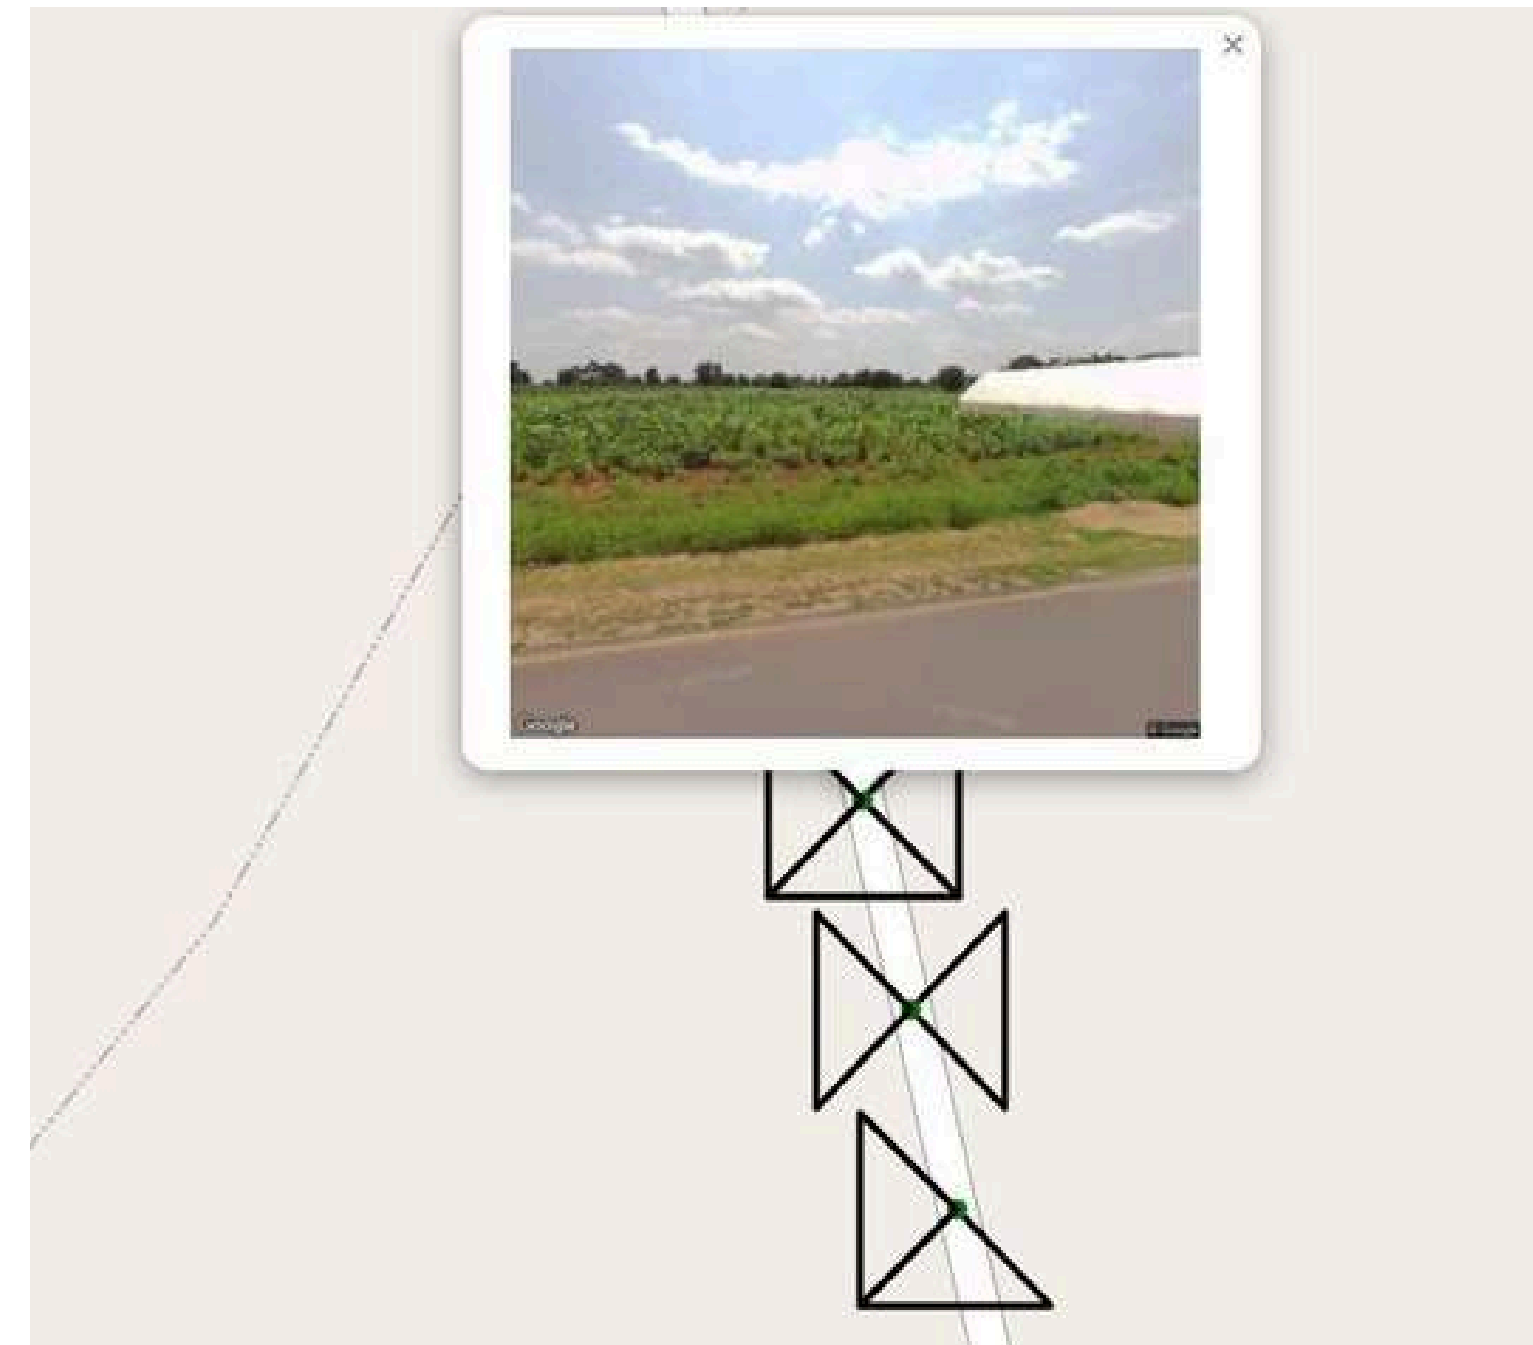

Description of Paul-Elio's work

Initial project status

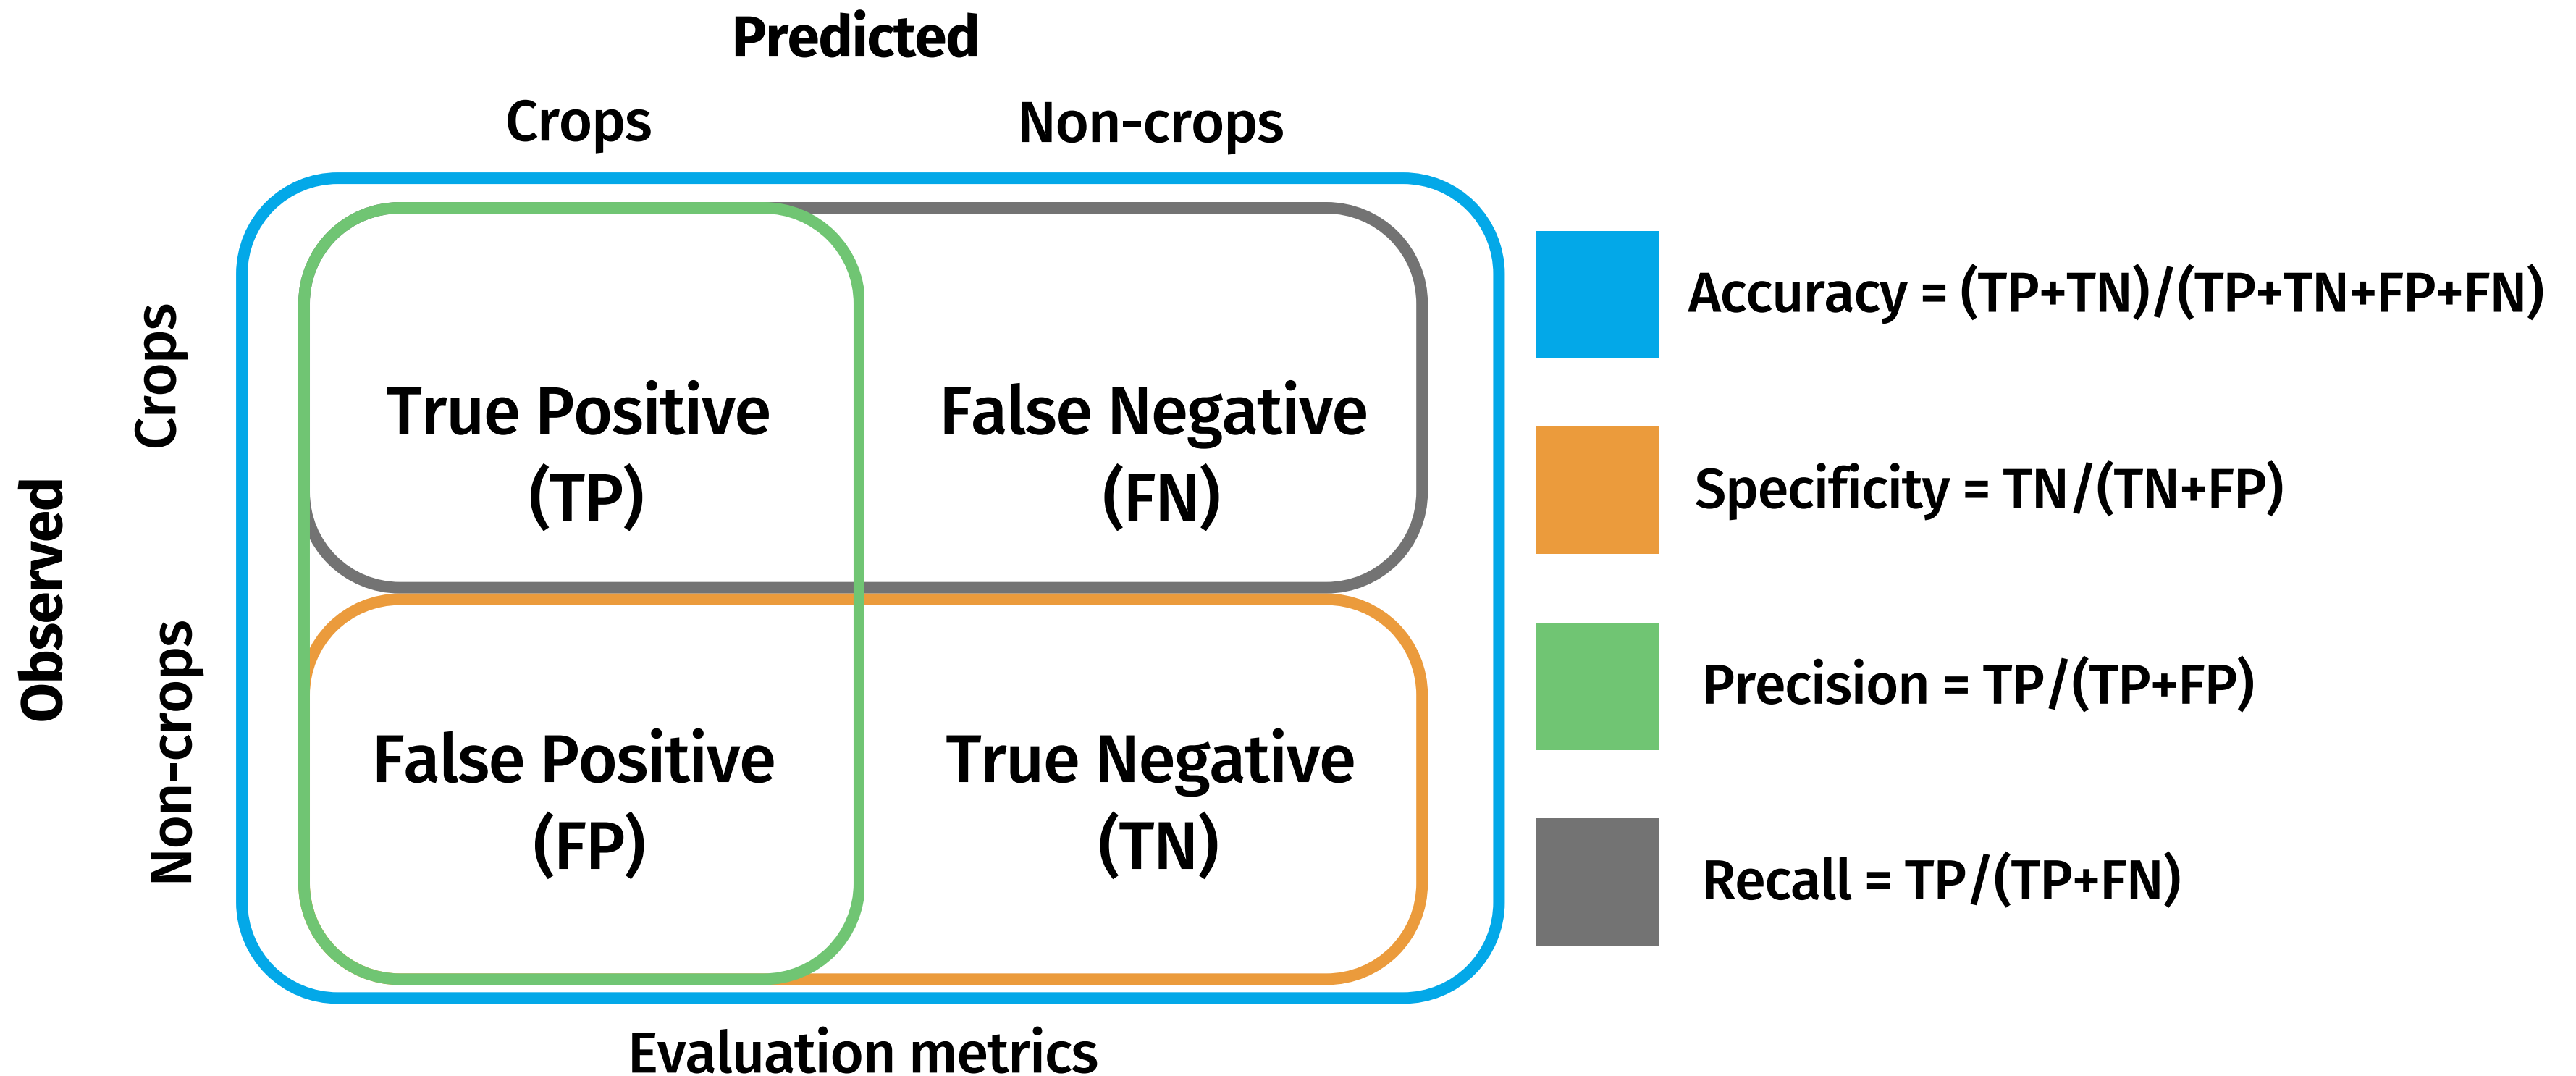

A map with triangles containing a crop
with the associated Google Street View
image

Final result of Paul-Elio's work

Metrics overview

Specifications

Service function	Expression	Assessment criteria	Level of flexibility
MF1	Reimplement Paul Elio's workflow	precision, memory storage	Precision > 90%
MF2	Match the GSV images with the satellite images	Locate the field spotted on a GSV image, return a data table of GPS coordinates	A point or a full segmentation
MF3	Classify the different types of crops	80%	Optional

Main functions of the specifications

Specifications

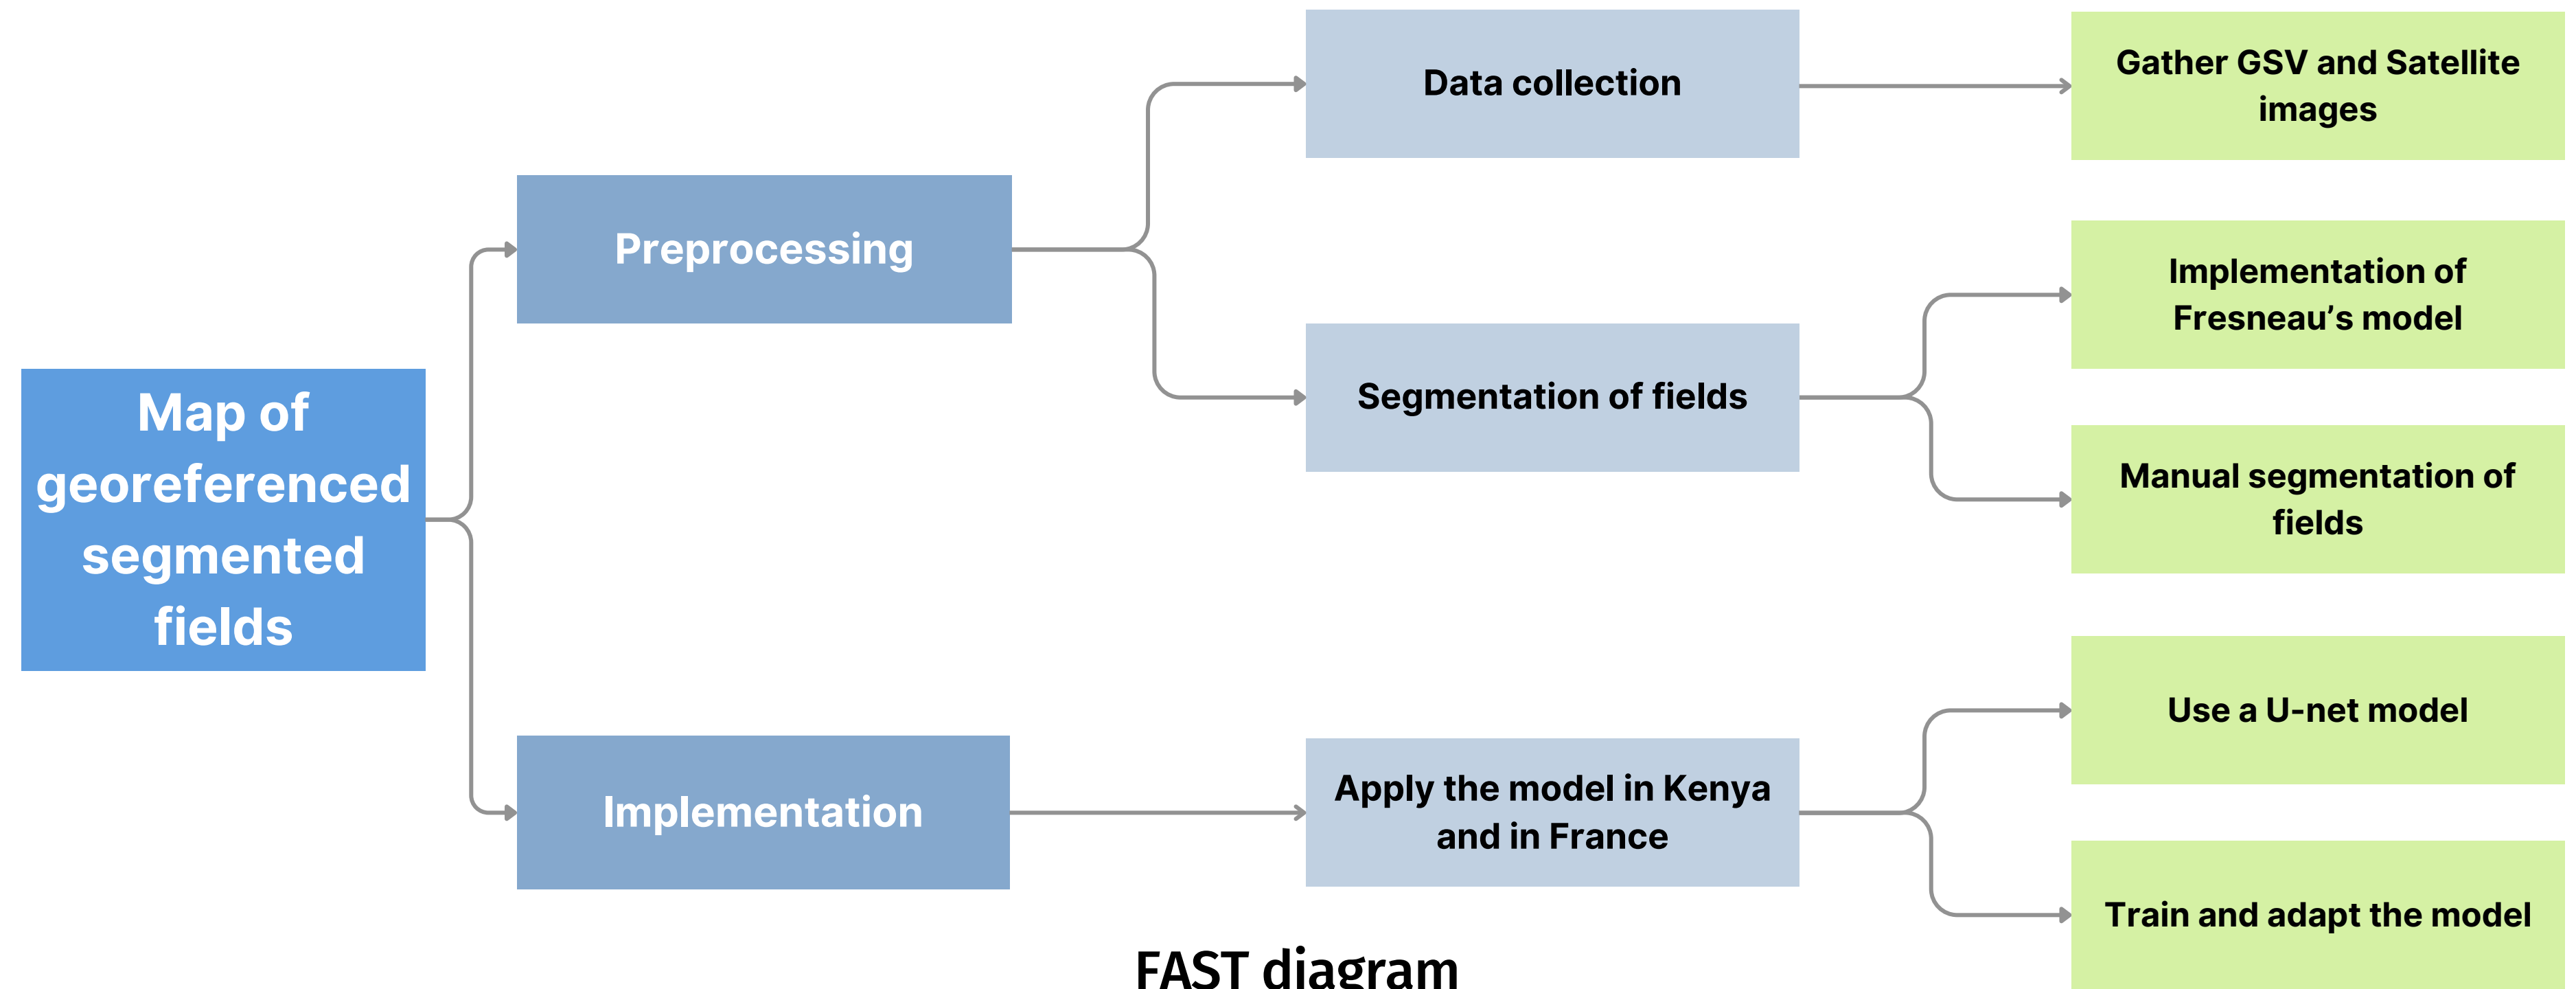

Service function	Expression	Assessment criteria	Level of flexibility
CF1	Make a reliable program	Get the evaluation metrics : France precision 90%, Kenya 80%	France +/- 5% Kenya : 75% minimum
CF2	Limited footprint	Memory storage	Limitation : 8Go RAM GPU
CF3	Flexibility of the program	Autonomous program	- Commented program - Less than 3 inputs required from user

IoU France : 48%
IoU Kenya: 53%

Constraint functions of the specifications

Field segmentation on satellite images

Detailed tasks allocation

Tasks allocation

Match GSV images with satellite images

Work on the current field detection model ✓

Enhancing the model ✓

Optimized code, filtering the data in cities ✓

Generalizing on all Kenya, instead of just a part (using a bigger training data set) ✓

Linking the model to our project ✓

Estimate the precise location of the field ✓

Place a point in the center of each field then locate it ✓

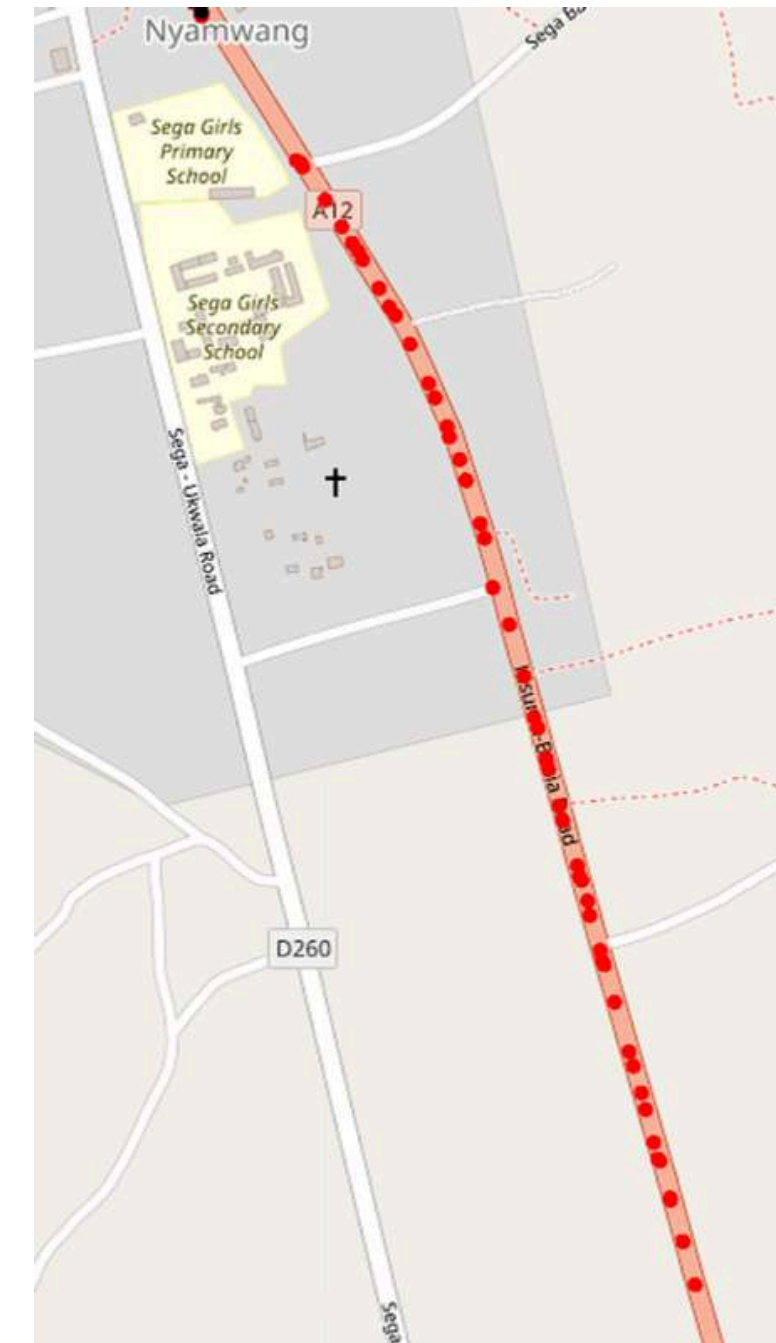

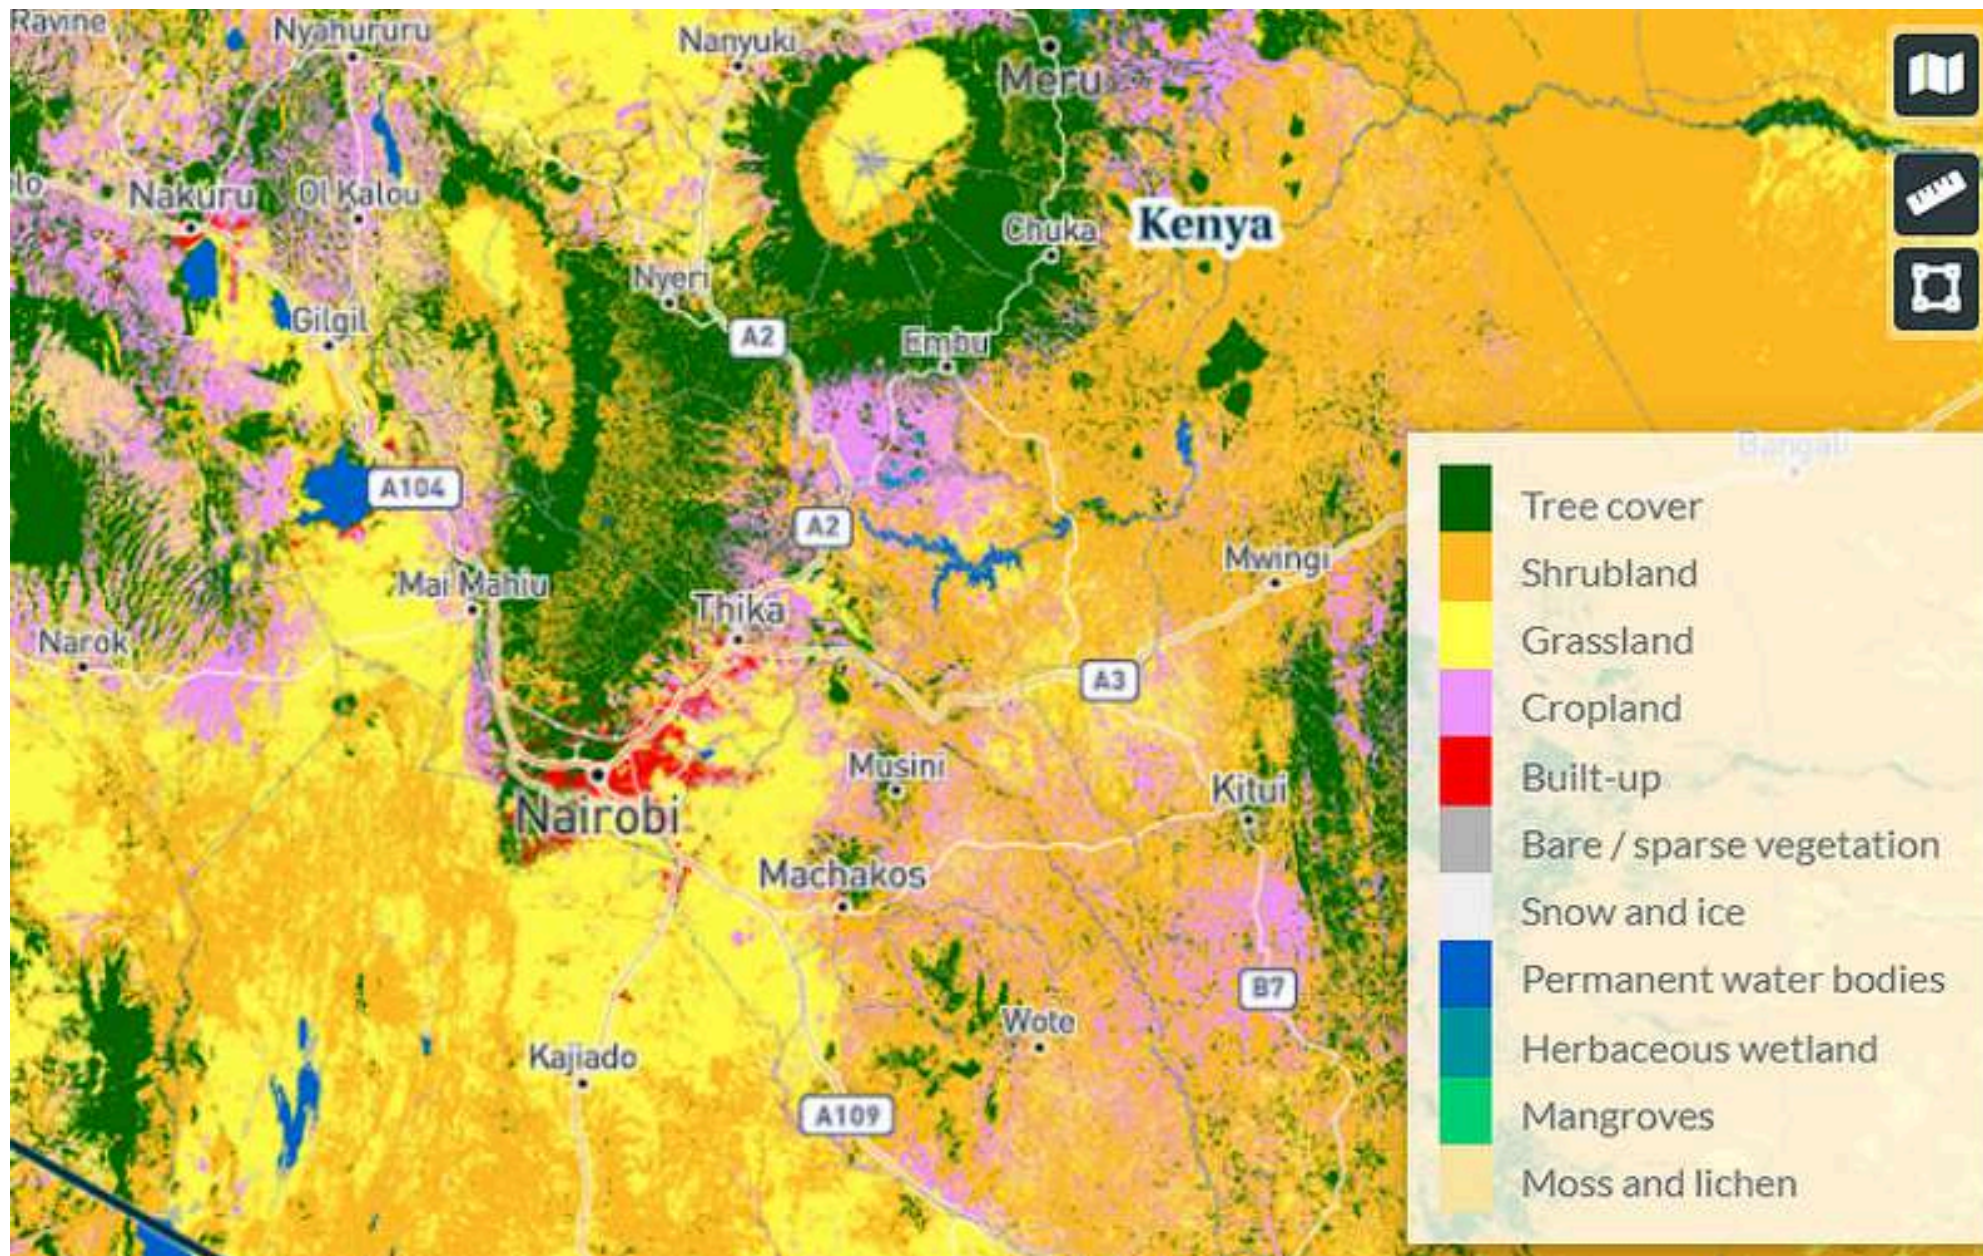

Final functional, complete github repository ✓

Our project

Segmentation model Workflow

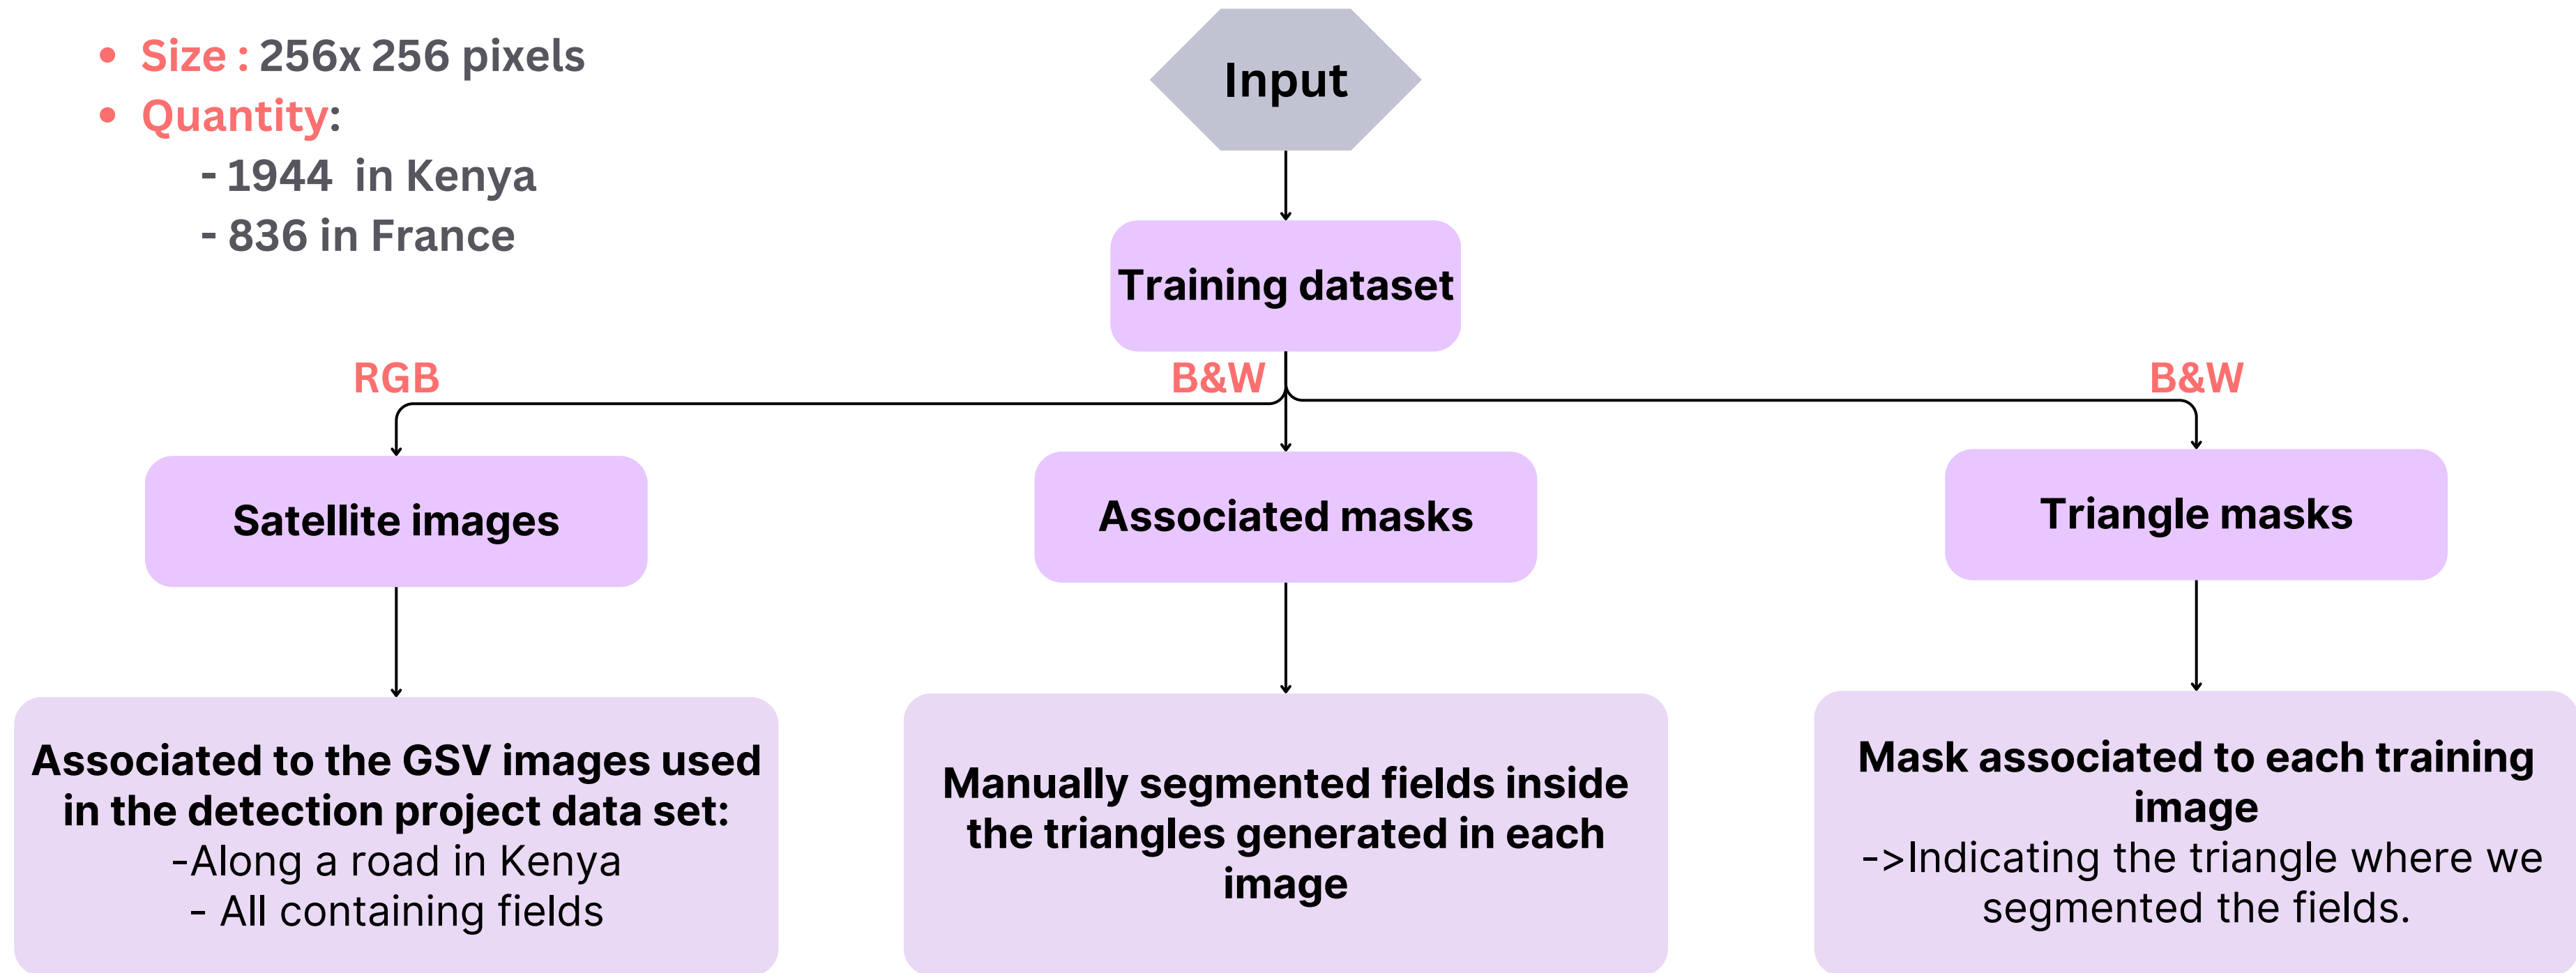

Our project

Input

- **Size** : 256x 256 pixels
- **Quantity**:
 - 1944 in Kenya
 - 836 in France

Our project

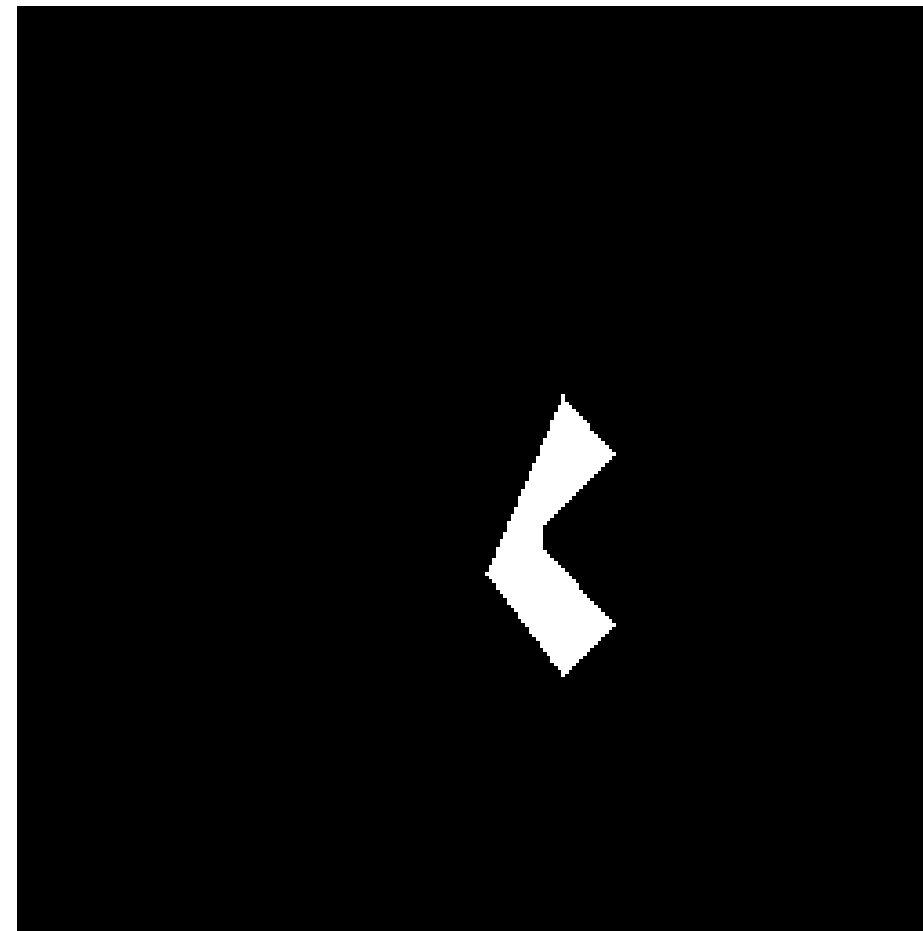

Input

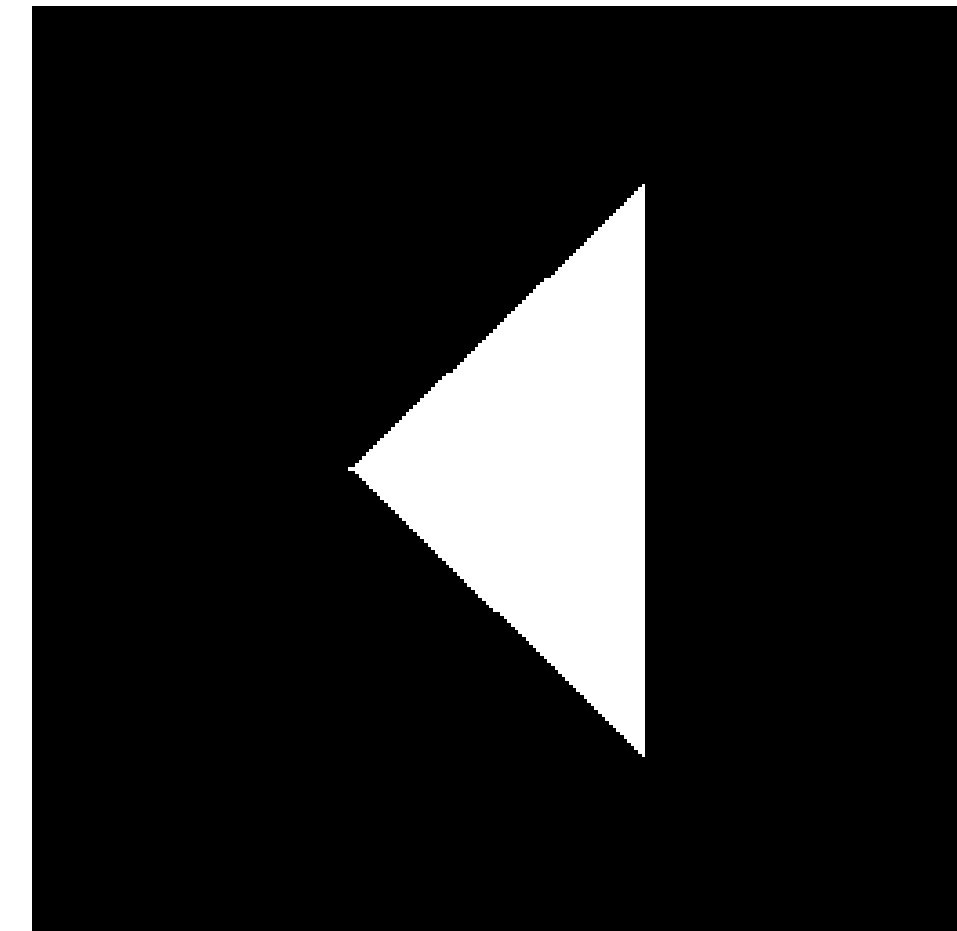

Satellite image

Associated mask

Triangle mask

- **Size** : 256x 256 pixels
 - U-net layers easier to design when images are a power of 2 in size.
 - Big enough to fit the triangle
 - Small enough to require the least memory and computational power.

Our project

Data augmentation

Rotation, flipping, scaling, adjusting brightness, contrast ...

- Increased dataset size
- Improved generalization
- Reduced **overfitting**
- Enhanced robustness

Constraints :

- Plausible variations
- Avoiding artifact introduction
- Ensuring quality

Our project

Data augmentation

Original image

Data augmentation

Vertical / horizontal flip

Brightness

$0.7 < \text{factor} < 1.7$

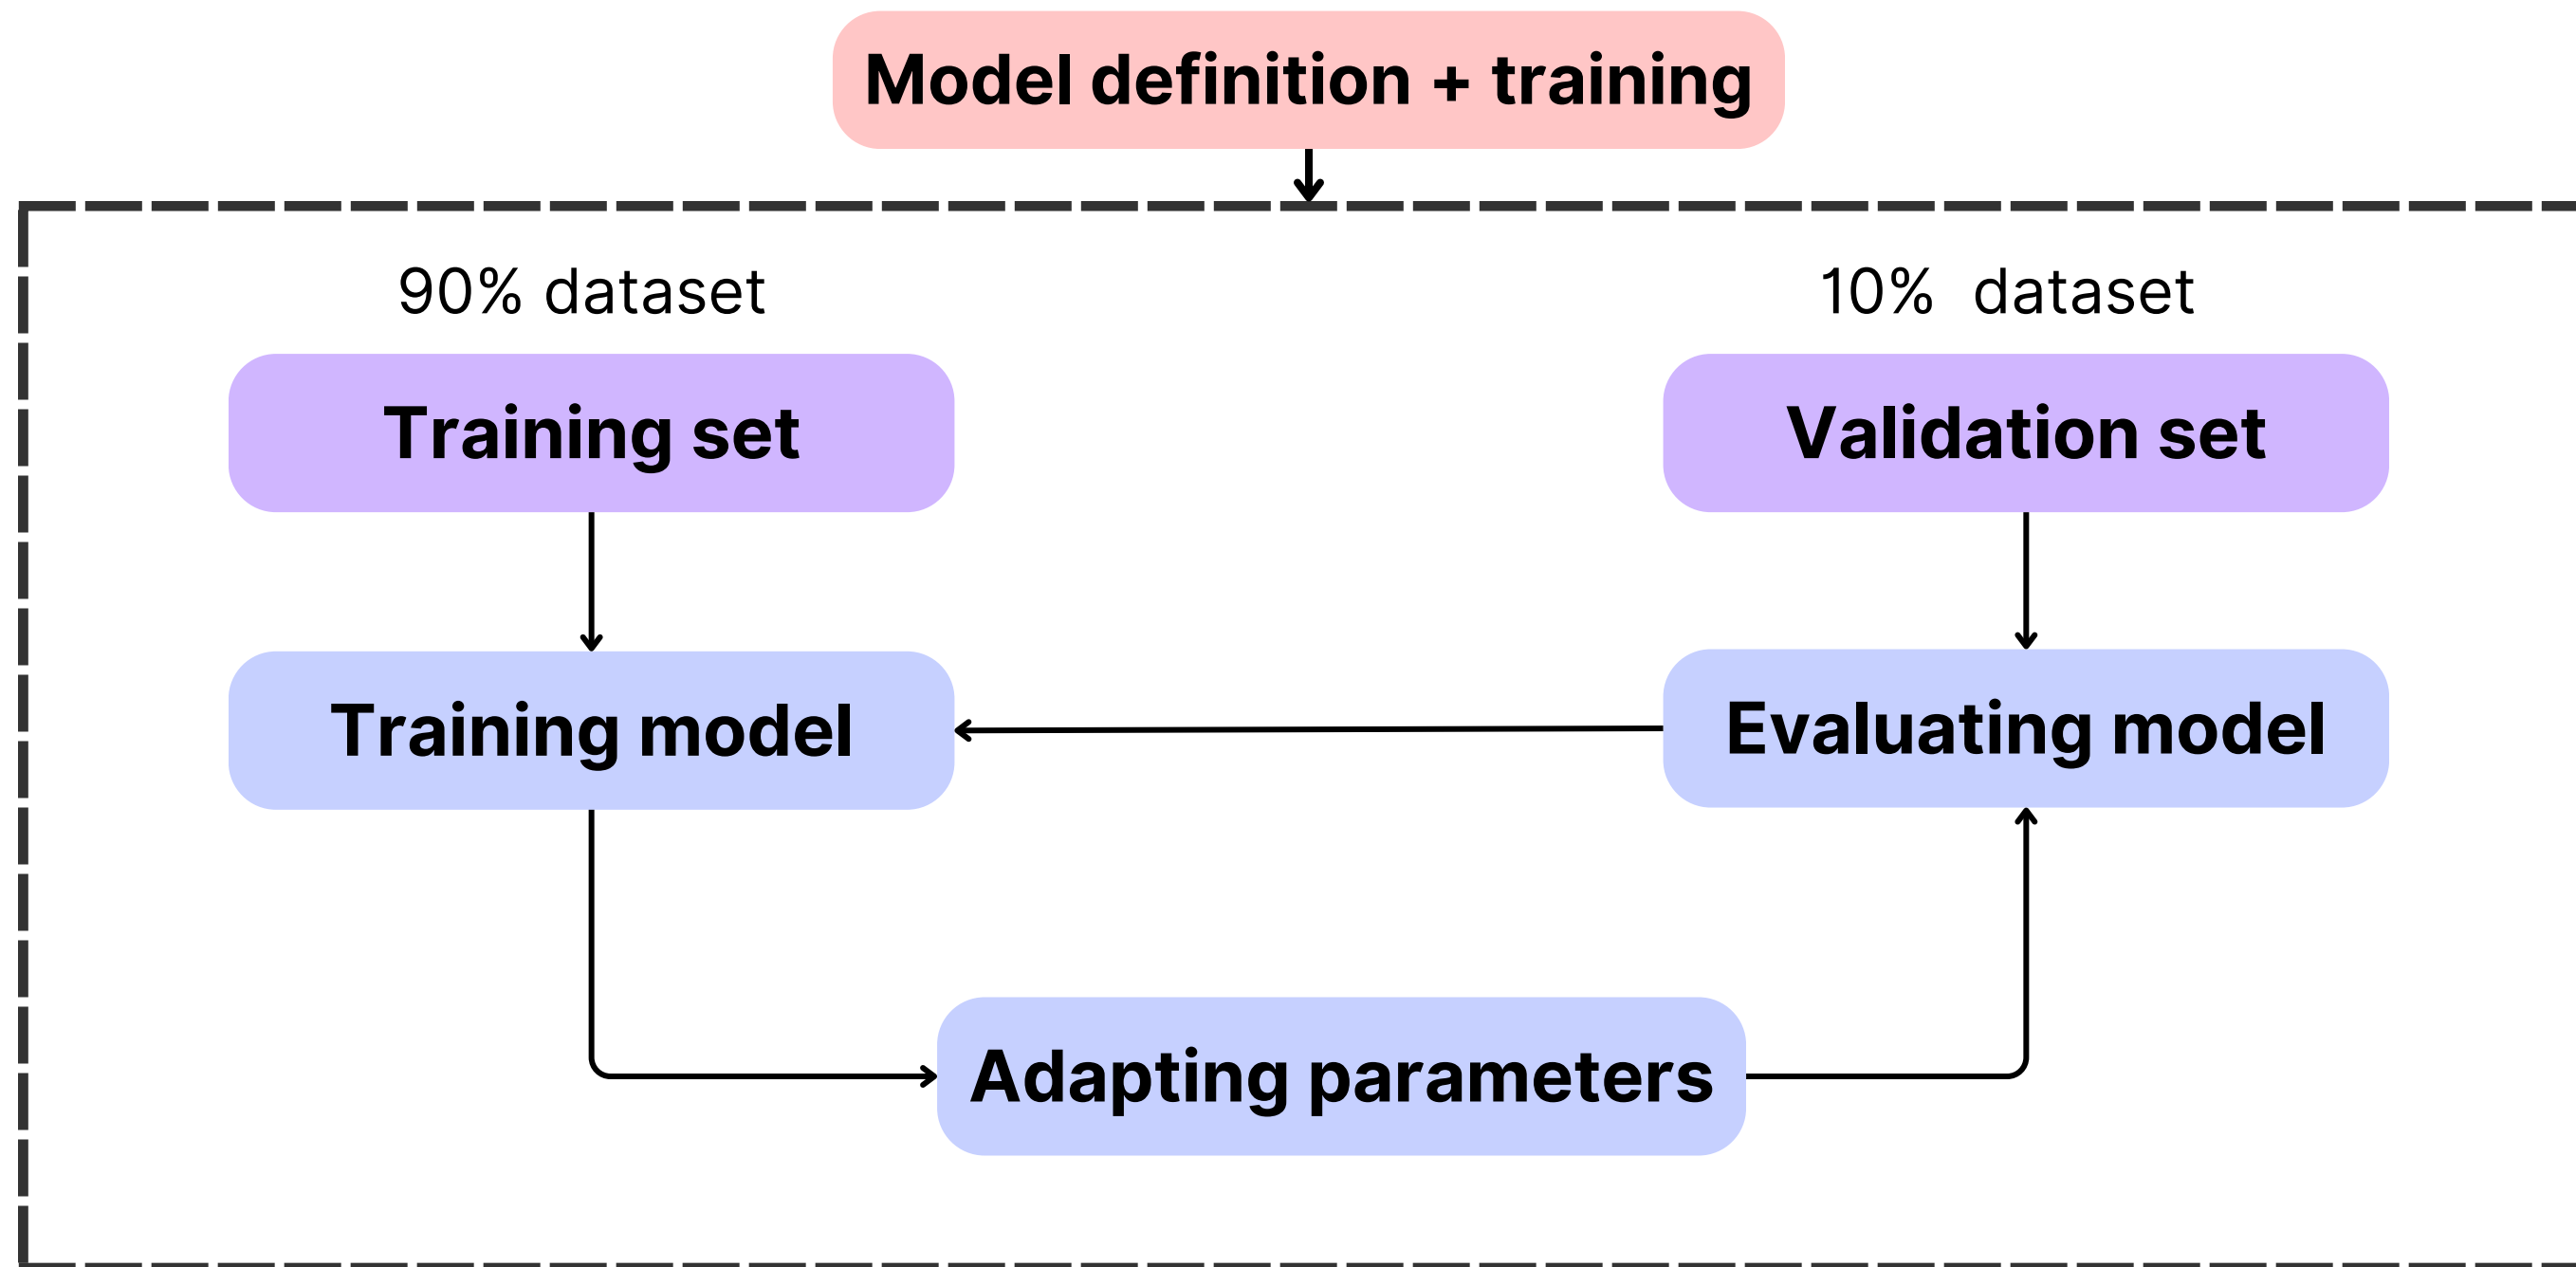

Zoom in

$1.2 < \text{factor} < 1.5$

Our project

Center of the predicted crops

- 1 Process the model prediction to identify **distinct regions**.
- 2 Calculate their centroids in **pixel coordinates**.
- 3 Convert these into **geographic coordinates** using GPS mapping and a calculated ground resolution.
- 4 Display results

Our project

Center of the predicted crops

The output of our program on the image

Amelioration points

Model optimization

- Increase the quantity and diversity of the dataset.
- Experiment with different architectures or customize the U-net with additional layers, skip connections etc
- Further hyperparameter tuning: learning rate, batch size, or optimizer choice.

Hardware upgrade

- Using more powerful computers in order to:
 - Accelerate the training time
 - Allow for more complex models or larger batches

Poster of the project

Project pipeline

Initial project status : Field detection model

Binary classification model for Google Street View images to indicate if they contain fields or not, trained in Kenya, that we later retrained in France.

Field segmentation model using U-net CNN

- Data collection, annotation and preprocessing.
- Implementation of a U-net CNN to segment fields within satellite images.
- Model training, evaluation and refinement.

Georeferencing the detected fields

Development of a program that identifies the centroid within each segmented field and calculates the corresponding GPS coordinates for precise geolocalization.

Results

Example output of segmentation

Original image

Overlay on original image

The image on the right illustrates the results after applying our model, with the segmented fields highlighted in red, indicating the model's predictions.

IoU metric: overlap between the predicted segmentation and the ground truth.
IoU obtained=53%

Field Geolocation

Original image

Field centroid

The program delineates fields in images using our model, marks each field's center, and outputs a CSV file with these centers' GPS coordinates.

Risks analysis

RI: Risk Indicator

PO: Probability of Occurrence

RC: Resolution Capability

I: Impact on the project

$$RI = \frac{I \times PO}{RC}$$

	Low	Medium	High
Probability	1	3	9
Impact	1	3	9
Resolution Capability	1	3	9
Risk Indicator	1	3 and 9	27 and 81

Scale of risks gravity

Project management

Risks analysis

$$RI = \frac{I \times PO}{RC}$$

Reference point	Risk	Probability	Impact	Resolution Capability	Risk Indicator
1.1	Exceed the memory	High (PO=9)	Medium (I=3)	Use an external hard drive (RC=9)	Medium (RI=3)
1.2	Loss of files	Low (PO=1)	High (I=9)	Archive files on Google Drive and on Seafile (RC=3)	Medium (RI=3)
1.3	Slow program execution	High (PO=9)	Medium (I=3)	Work on GPU instead of CPU (RC=3)	Medium (RI=9)
1.4	Exceed the maximum of free images	Low (PO=1)	Low (I=1)	Create an Excel document and a python script to count downloaded images (RC=1)	Low (RI=1)

Technical risks table

Project management

Risks analysis

$$RI = \frac{I \times PO}{RC}$$

Reference point	Risk	Probability	Impact	Resolution Capability	Risk Indicator
2.1	Be overwhelmed by the courses	High (PO=9)	Medium (I=3)	Respect the schedule and work during extracurricular hours (RC=9)	Medium (RI=3)
2.2	Different timetables due to our chosen option	High (PO=9)	Low (I=1)	Virtual meeting or meeting after courses (RC=3)	Medium (RI=3)

Environmental risks table

Project management

Risks analysis

$$RI = \frac{I \times PO}{RC}$$

Reference point	Risk	Probability	Impact	Resolution Capability	Risk Indicator
3.1	Lose connection with our client	Low (PO=1)	High (I=9)	Communicate regularly with our supervisors (RC=3)	Medium (RI=3)
3.2	Lose a member	Low (PO=1)	High (I=9)	Restart all the organization of the project (RC=1)	Medium (RI=9)
3.3	Lose motivation	Medium (PO=3)	Medium (I=3)	Organize team buildings (RC=3)	Medium (RI=3)

Relational risks table

Conclusion

Project management

- Monthly reports
- Meeting reports
- Public and technical reports
- Human and technical assessment
- Schedule
- Budget
- Poster / Video

Technical aspects

- Deploying a pipeline from binary field detection to field localisation in : Kenya and France
- Implementing a segmentation model
- Implementing a program to localise the segmented fields
